

Unexploded Ordinance (UXO) Detection Projects with BX305

in Australia, New Zealand and Laos

Anton is an engineer from Australia. His team have been using the Preci-BX305 GNSS/GPS system for unexploded ordinance (UXO) detection projects in Australia, New Zealand and Laos.

They have a walking UXO detector with the rover BX305 module receiving GPS corrections and outputting the sub decimeter accuracy GPS to a data logging system.

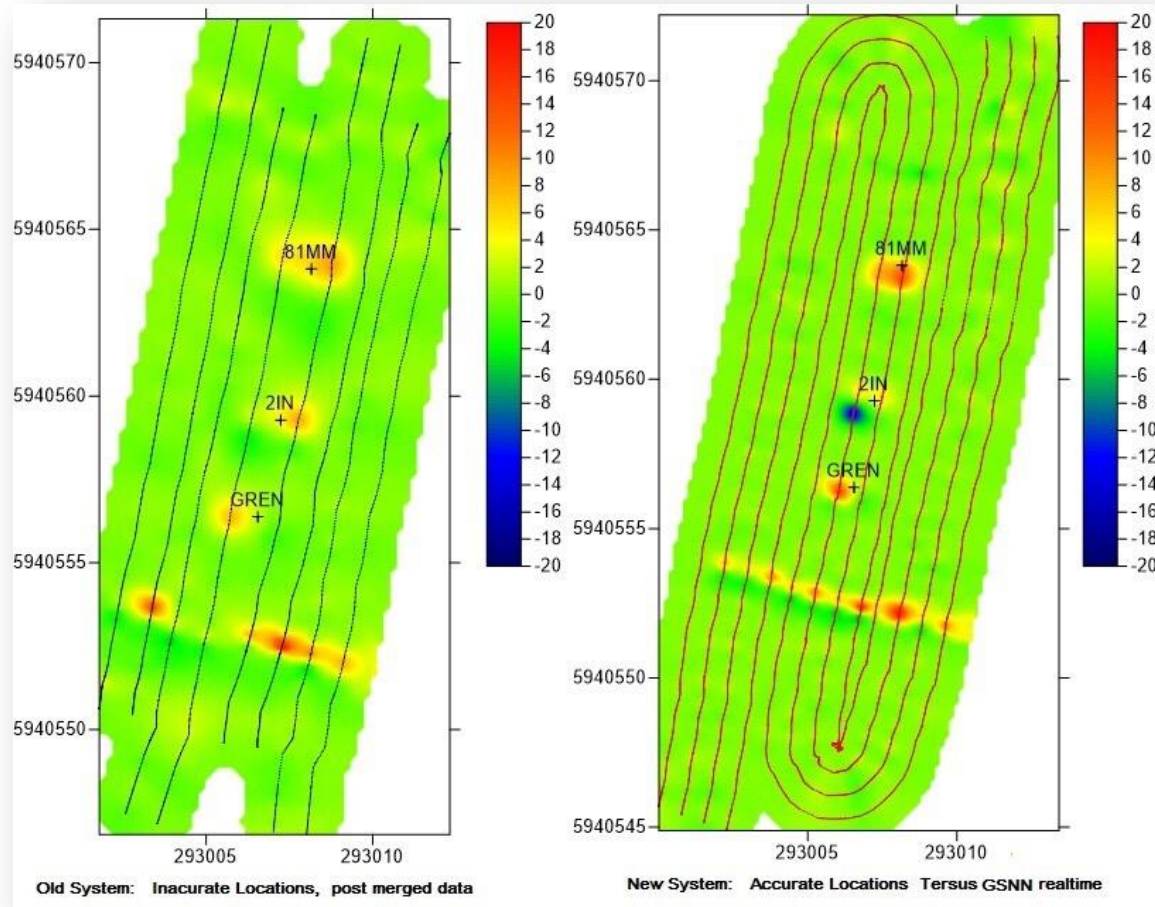

“

The unexploded bombs need to be detected with an accuracy of less than 20cm, and using the Precis system we have easily achieved this. We are happy with Preci-BX305 GNSS GPS system and its performance.

”
